VEP
Vertical Edgeless Preparation:
periodontal dominance
in prosthetic preparation

QUINTESSENCE PUBLISHING

Edición: 1st Edition 2024
páginas: 80
Imágenes: 322
Portada: Softcover, 21 x 28 cm
ISBN: 978-88-7492-213-0
Nº de stock: BI045
Publicado en: julio 2024

Precio \$59.00
Sujeto a cambios.

Título: VEP Vertical Edgeless Preparation

Subtítulo: Periodontal dominance in prosthetic preparation

Texto breve:

VEP, our acronym for *Vertical Edgeless Preparation*, is a full-crown prosthetic preparation method indicated for teeth that have lost attachment tissue – even where probing depths are minimal (≤ 3 mm) – and consequently have incomplete periodontal support. This technique involves extending the preparation subgingivally to ideally treat the entire exposed root surface as far as the epithelial attachment.

As the name suggests VEP does not produce a post-preparation edge. Instead of a marked finish line and associated transition angle, the technique creates a vertical tooth wall extending from the bottom of the sulcus on which the prosthetic crown margin may be positioned at a flexible height while still ensuring a reliable seal.

The periodontal dominance of VEP is due to the marginal periodontal tissue response to the subgingival preparation work: the healed tissues go on to submerge the inevitable transition angle remaining at the apical end of the prepared surface. This leaves a prosthetically exploitable axial wall area with no angles or margins, therefore edgeless.

This publication presents and describes the methodology along with a review of the underlying concepts including the Cartesian coordinate system and significant orders of magnitude. A new simplified classification is proposed dividing the various prosthetic preparation techniques into two straightforward groups.

Attention is also paid to the anatomical, histological and physiological aspects regarding the marginal periodontium which account for the periodontal dominance of this procedure. A detailed innovative analysis follows of the rationale behind extending prosthetic preparation apical to the gingival margin based on periodontal assessment of the tooth requiring treatment.

VEP is then described in practical terms including the various clinical and laboratory stages, instruments and operative sequence while comparing classical applications with more recent approaches in the light of ongoing technological developments.

Contents

Chapter 1. Geometry, Terminology, and Classification of Prosthodontics Preparation techniques

Chapter 2. Periodontal Dominance in VEP

Chapter 3. Tooth preparation: clinical and laboratory aspects

Chapter 4. Indications and advantages of VEP

Categorías: Prótesis, Odontología restaurativa, Periodoncia
